

## Looking back on our 2003 Fantasy Baseball Projections

Projecting the direction of fantasy production year over year on a player by player basis is the core to a successful fantasy season. This core forms the foundation of our service. A service that combines our historically successful mathematical projections model with qualitative insight from our staff of editors which includes first person scouting.

Below is a breakdown of Fantistics 2003 Preseason Baseball Projections. In 2003 we achieved results that are very reminiscent to our 5 year track record of prognosticating. We projected the correct direction as measured by [FPI](#), the most accurate indicator of of Fantasy Value (see article comparing FPI to well known Stat indicators), **the correct direction, (either up or down) on close to 7 out of 10 MLB batters & close to 8 out of 10 MLB starting pitchers.** We believe that projecting the correct direction to a player's production is as valid as any indicator to fantasy success. This is not saying that every subscriber had the same fantasy success, as one's fate may have been sealed by selecting several players who did not live up to expectations, sustained production disrupting injuries, or encountered drops in playing time (something that FPI does not measure).

We look forward to your continued success in 2004.

*Grid Explanation: The grids below highlight the relevant FPI (Prior season, 2003 Projection, and 2003 year end actual), and the differences. Column (A-B) compares the prior year's FPI (A) with the Preseason Projection (B). Column (C-A) compares the Actual 2003 final year stat (C) with the prior year (A). If the players fantasy production increased or decreased and matched our projected direction, then we consider that a "Correct" direction with our projection, conversely if the Actual difference is different than the Projected difference, then we were "Wrong" with our projection.*
